Q: Create a runtime class with a class template parameter I have some functions I need to call from within a C++ program with a template parameter, say a class C. My question is how can I instantiate an object of C using a runtime class? For example C d; A: There are two options. First, if you want to instantiate the template parameter object of class C at compile-time, you can use the template itself. You can do this, for example, by defining a static variable in the same translation unit: C class_instance; If you want to instantiate it at runtime, your options are different. One option is to use a macro that expands to code which instantiates the class. For example, if you define a macro #define ASSERT(x) assert(x); and then define a function void my_function(int i) { ASSERT(i); // do something } then my_function is compiled as void my_function(int i) { ASSERT(i); // do something } There's also the runtime_check function from , which can be used to dynamically instantiate the template type itself, at runtime. Include annotations from, and produce annotations for, drawings based on drawings you've imported into AutoCAD. Make sure the entire surface of a drawing is visible in a view by hiding other objects. (video: 1:10 min.) With Markup Assist, you can find the material that's inside a profile and then apply it to the part. You can also determine the type of material that a shape was made from and then select the right profile in the job definition to apply it. (video: 2:09 min.) Change an aspect ratio of a profile to fit the shape you've drawn. (video: 1:02 min.) See important notes in your drawings so you're not distracted from the work at hand. With the Export functions, save your drawings as PDFs, JPGs, and GIFs. You can also export your drawing as DXF. Save Draft Objects as Symbols and Save Completed Symbols as DXFs: In the Select Functions and Text box, choose Draft Objects if you want to save a symbol as an AutoCAD object. If you want to save a draft object as a DXF file, choose Completed Symbols. (video: 1:19 min.) Extend Shape Objects and Line Series Objects: When you add a path to a shape, you're not adding individual shapes to the path. The shape just grows and grows until it becomes as large as the path allows. Now, when you extend the shape, it will maintain its size along the entire path. This makes it easier to control the shapes and lines in your drawing. (video: 1:04 min.) You can use a function called shape object. Now, you can find a specific shape by entering a name in the Search field. This helps you manage your drawings more easily. (video: 1:19 min.) Save the style of your lines and shapes, even if they're not in a text box. When you don't want to modify them, you can save the lines and shapes as symbols and then bring them into your drawings. The new symbols are based on the style of your shapes. With color, you can select the entire surface of your drawing by clicking an object and setting the box to Solid Color. This is useful for color schemes and other shared
